Activities - Attributes and discussion

Activities - Attributes

Please find below suggested activities to help you practice:

1. Find the list of supported attributes for the `<area>` tag. (*Hint: use the [W3C cheatsheet](#) or [MDN attribute reference list](#)*)
2. Create two paragraphs with the same `id` and run your code in a CodePen. What happens? We know the value of the `id` attribute must be unique, so why does it behave the way it does? Run your code through the [W3C Markup Validator](#). Does it throw an error?
3. Does an attribute called `src` exist? What is the purpose of this attribute and what are the elements it can be applied to? (*Hint: refer to the W3C HTML5 specification, W3C cheatsheet or MDN attribute reference list*)
4. Create an ordered list starting with the number 11. Then, reverse the list. Give it the following title (when you hover your mouse, it should display the title as a tooltip): 'Activity List'.

Note: If you wish to share your HTML code in the discussions, you can paste your code directly in a discussion forum post (highlight code and Ctrl+K/use the code widget) or use one of the following online code editors:

- JS Bin: <http://jsbin.com> ([JS Bin tutorial](#))
- CodePen: <http://codepen.io> ([CodePen tutorial](#))

These are HTML, CSS, and JavaScript code editors that preview/showcase your code bits in your browser. It helps with cross-device testing, realtime remote pair programming.
